I. Introduction

In the midst of Vietnam's progressing change, the advancement of innovation stages like Get and ShopeeFood has given rise to an unused shape of labor - platform-based business. This show not as it were makes adaptable work openings, especially for youthful laborers, but moreover raises essential issues related to generation relations, labor rights, and the position of specialists within the advanced economy.

According to Marxist-Leninist theory, the definition of the working course isn't based on the outward frame of labor but on their position within the framework of generation relations, particularly their relationship to the implications of generation and the method of esteem creation. Subsequently, examining the gathering of understudies working as ride-hailing drivers not as it were has viable centrality in reflecting an unused labor drift, but moreover has hypothetical value in recognizing and analyzing the change of the working lesson within the setting of the computerized economy.

Based on this, this article points to analyze the characteristics of this principal labor bunch through down to earth study information, in this manner clarifying three key issues: deciding whether this labor bunch can be considered the modern working lesson agreeing to Marxist-Leninist theory; the modern changes of the working lesson within the advanced economy; and clarifying the clashes of intrigued as well as the capacity of the working course to fulfill its chronicled mission within the current setting.

II. Research Methodology and Survey Overview

2.1. Research Subjects and Scope

This consideration was conducted through a study of understudies specifically included in conveyance exercises on innovation stages such as Grab and ShopeeFood. The determination of these investigating subjects stems from the truth that this bunch speaks to an ordinary

workforce for the "stage labor" drift within the computerized economy, particularly predominant among youthful laborers in urban ranges.

With respect to the scope of the investigation, the survey focuses on analyzing the fundamental characteristics of stage labor, counting working conditions, pay, level of reliance on the stage, as well as the recognitions and encounters of the specialists. In spite of the fact that the sample size is restricted and not a profound agent of the whole stage labor constraint, the collected information still reflects ordinary patterns and issues. Therefore, this ponder is important for recognizing the characteristics of the working course within the setting of the advanced economy from a Marxist-Leninist hypothetical viewpoint.

2.2. Data Collection and Processing Methods

The information collection strategy utilized was a web survey (Google Form), combining quantitative and open-ended questions. Quantitative questions centered on collecting data approximately working hours, wage, level of reliance on the stage, and protection status, pointing to reflect the objective characteristics of working conditions. In the meantime, open-ended questions were planned to dive more profound into the recognitions, individual encounters, and subjective assessments of workers regarding their occupations.

This combined approach permits for both measuring common patterns and clarifying subjective perspectives, appropriate for investigating prerequisites within the field of Logical Communism, where an association between home and hypothesis is fundamental.

With respect to information preparation strategies, quantitative reactions were totaled and analyzed through expressive measurements (frequency, percentage), while subjective information were categorized by point to highlight key issues related to working conditions, dependency levels, and conflicts of intrigues. The investigation is displayed within the frame of charts and rundown tables (see Appendix) to bolster the contentions within the taking after segments.

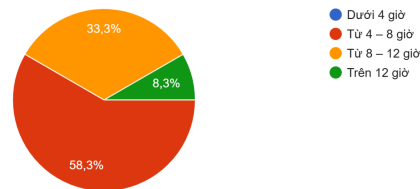

III. Survey Results and Data Analysis

The survey results reveal vital characteristics of stage specialists among understudies. Demographically, the larger part of members are matured between 18 and 23, reflecting the characteristics of a youthful workforce leveraging innovation stages to create extra salary. In terms of sex, guys constitute a better extent, which may be related to the nature of the work requiring visit travel and moderately tall labor concentrated. Regarding work stages, the lion's share of laborers work on applications such as Grab and ShopeeFood, showing a concentration of platform laborers inside a couple of expansive innovative biological systems.

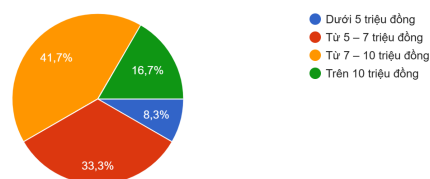

Regarding working conditions, the larger part of laborers spend between 4 and 8 hours per day on conveyance activities. This proposes that in spite of the fact that the work offers adaptable hours, specialists still ought to keep up a generally tall labor escalated to guarantee their wanted pay level. In other words, adaptability within the work environment does not

compare to decreased work weight; in numerous cases, it indeed includes amplifying working hours to compensate for salary fluctuations.

Câu 5: Trung bình mỗi ngày bạn làm việc bao nhiêu giờ?
12 câu trả lời

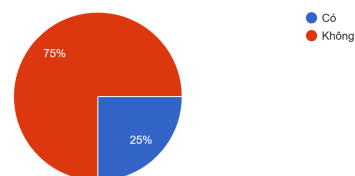

Câu 6: Thu nhập trung bình hàng tháng của bạn là bao nhiêu?
12 câu trả lời

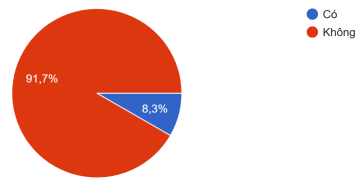

The average income of platform workers ranges from 5 to 10 million VND per month; however, it is unsteady and intensely dependent on the number of orders as well as outside variables such as working hours, area, and stage approaches. It appears that laborers don't really control their salary era handle, but are altogether affected by the work dissemination component and calculations of stages like Grab and ShopeeFood. In other words, the decision-making control with respect to workload and pay does not lie with the laborers, but with the working framework set up by the businesses.

Furthermore, a prominent characteristic is that the majority of specialists don't have formal work contracts and are not secured by social protection plans. This clearly reflects the casual nature of stage labor, where labor relations are not completely institutionalized inside the conventional legitimate system. As a result, dangers related to work mishaps, wellbeing, or wage variances are borne exclusively by the person laborers. This move in obligation reflects a shape of asymmetry in labor relations, where businesses minimize their commitments whereas workers face higher levels of chance within the course of their work.

Câu 7: Bạn có ký hợp đồng lao động chính thức với nền tảng không?
12 câu trả lời

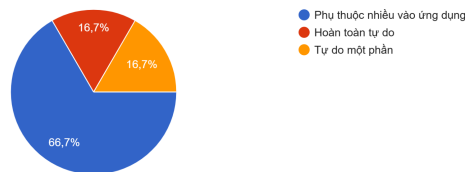

Câu 8: Bạn có được tham gia bảo hiểm (y tế/xã hội) không?
12 câu trả lời

Regarding the level of dependence, the majority of workers rate their dependence on the platform as high. The platform's algorithm acts as an invisible labor control mechanism, determining the distribution of orders and income.

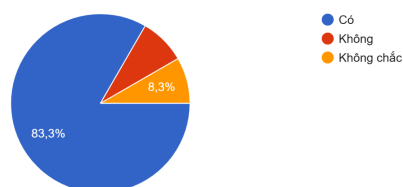

Câu 13: Bạn có thể tự quyết định công việc của mình không?
12 câu trả lời

Notably, the larger part of specialists are mindful of themselves as "employees," indeed without formal work contracts. This recommends their recognition isn't based on lawful customs but or maybe on their commonsense reliance on the framework for work and wage dissemination.

At the same time, they tend not to commit to long-term employment, basically seeing it as brief work to meet short-term pay needs. This combination of the "employee" discernment and the "temporary" attitude reflects the precariousness of the essential labor framework and debilitates the capacity to make lesson awareness and lock in in collective activity.

Câu 15: Bạn có nghĩ mình là người "làm thuê" cho nền tảng không?
12 câu trả lời

From a theoretical perspective, it appears that specialists are controlled in most stages of the labor preparation. This control isn't direct as the conventional administration demonstrates, but is worked out by implication through algorithmic frameworks, arrange dispersion instruments, and execution assessment approaches. In this setting, laborers do not depend on the stage for getting to work, but are moreover affected in terms of work pace, salary, and access to work openings.

This may be seen as a modern shape of generation relations, in which control of the means of production - especially the technology platform and data - is concentrated in the enterprise, whereas laborers still need to offer their labor to outlive. In spite of the fact that the shape of expression has changed compared to conventional mechanical labor, in pith, the subordinate relationship between labor and capital is kept up, and indeed gets to be more modern through mechanical components.

IV. Theoretical Analysis: The Working Class in the Digital Economy

4.1. Identifying the Working Class in the Foundation of Labor

Based on the comes about of a viable study of a gathering of students working as ride-hailing drivers, their position within the framework of generation relations can be identified and analyzed concurring to Marxist-Leninist hypothesis.

First, agreeing to the essential criteria of Marxist-Leninist hypothesis, the working class consists of individuals who don't claim the implications of generation and must offer their labor to outlive. In this case, in spite of the fact that specialists may possess individual implies such as cruisers or smartphones, these components are not unequivocal within the generation prepared. The center implies generation - counting the innovation stage, information frameworks, arrange conveyance calculations, and client organization - are under the control of businesses like Grap and ShopeeFood.

The study appears that the lion's share of laborers are totally subordinate on the stage for business, as proved by their failure to discover clients themselves and their dependence on the framework for arrange dispersion. At the same time, 90.9% of members conceded to being "representatives," and 81.8% had no purposeful of remaining in their occupations long-term, clearly illustrating the reliance and precariousness in labor relations.

Hence, considering the criteria of proprietorship implies generation and position in generation relations, it can be confirmed that this bunch of laborers has a place to the advanced working lesson, in spite of the fact that in a non-traditional shape of labor inside the computerized economy.

4.2. Surplus Value in the Platform Labor Model

More importantly, in the event that is analyzed according to Marx's theory of value, it can be seen that excess esteem exists in an unused shape within the stage labor show. Specialists straightforwardly perform administrations and make esteem, but the included esteem is conveyed through markdown instruments, benefit expenses, and reward-punishment approaches decided by the stage.

Study information appears that salary is unsteady and subordinate on the calculation for distributing orders, reflecting the reality that laborers don't control the income of their labor. In this way, this will be seen as a frame of roundabout excess esteem misuse, carried out through innovation instead of through coordinate labor relations as in mechanical generation.

In any case, it ought to moreover be famous that a few sees that stage labor does not totally have a place to the working course, due to their tall adaptability and need of being bound by conventional labor contracts. Be that as it may, in pitch, stage laborers stay dependent on the stage for employment and pay, and have no control over the value creation handle. Hence, these "flexible" components don't change their position within the production relations, but simply reflect a change within the shape of labor. In any case, a counter-argument exists that stage laborers don't totally have a place in the working lesson within the conventional sense. The reason is that stage specialists have a certain degree of adaptability in choosing their working hours and are not bound by long-term work contracts. A few consider that they are closer to the "specialist" show than mechanical specialists.

All things considered, in the event that we dig more profound into the nature of the generation relations, these "freedom" components are simply typical. Workers remain totally subordinate on the stage to get to clients and pay era, and are controlled by calculations they cannot impact. Hence, adaptability does not alter their subordinate position, but is just an unused appearance of labor relations within the advanced economy.

4.3. New Transformations of the Working Class in the Digital Economy

Other than characterizing the lesson nature, it is fundamental to analyze the modern changes of the working course within the setting of the computerized economy.

To begin with, the platformization of labor is clearly apparent when the complete work handle is facilitated through mechanical frameworks. Laborers now do not work beneath the coordinate supervision of administration, but are controlled by calculations - an undetectable component but one that definitively impacts income and workload.

At the moment, the slant of information is progressively apparent. The larger part of laborers don't have labor contracts and are not secured by social protections, driving to all dangers being exchanged to the person. Study reactions such as "no insurance, if an accident happens, I bear it myself" clearly appear in this issue.

Third, there exists a combination of adaptability and instability. Laborers can proactively select their working hours, but their salary is unsteady and depends on numerous variables past their control, such as the number of orders, climate, and stage arrangements. This appears that adaptability is simply shallow, whereas the substance remains reliant and precarious.

Fourth, a high degree of labor individualization is watched, with each specialist working freely, missing collective linkages. This debilitates the capacity to create lesson awareness and limits the capacity for collective organization.

In expansion, a few components of intellectualization are starting to seem, shown in laborers having to utilize innovation and get it the working components of the framework to optimize their wage. In any case, this level of intellectualization has not, however, changed their subordinate nature in generation relations.

From both overview information and hypothetical investigation, it can be asserted that foundational labor could be a modern sign of the working lesson within the advanced economy. In spite of the fact that the frame of labor has changed altogether, the inalienable reliance and unequal dispersion within the esteem creation prepare to stay. This appears that the working lesson has not vanished but is changing in shape, requiring an adaptable hypothetical approach that still follows the substance of Marxism-Leninism.

V. Conflicts of Interest and the Historical Mission of the Working Class in the Digital Economy Context

5.1. Conflicts of Interest in Platform Labor

From the results of the practical survey, it can be seen that there are clear conflicts of interest between platforms and workers. On the part of businesses like Grab and ShopeeFood, the core goal is to maximize profits through optimizing operating costs, improving delivery efficiency, and tightly controlling the labor process. Meanwhile, workers desire stable income, safe working conditions, and guaranteed basic rights such as insurance and risk support.

This conflict is not just a phenomenon but reflects the nature of production relations in the digital economy. Survey data shows that workers often face unstable income due to dependence on the number of orders, while operating costs (fuel, vehicle maintenance) are paid by individuals themselves. Notably, 90.9% of participants admitted to being "employees," and 45.5% rated their dependence on the platform as the highest, clearly reflecting the dependence of workers.

The collected opinions also revealed an imbalance between labor effort and income, such as the statement: "one has to work many hours to earn enough to live on." At the same time, the lack of labor contracts and insurance shifts all risks to the worker, representing a form of benefit asymmetry where businesses minimize responsibility while workers bear the majority of the risks.

From a Marxist-Leninist theoretical perspective, these contradictions are concrete manifestations of the fundamental contradiction between labor and capital in the new conditions. While in industrial production, the contradiction is directly expressed through wages and working conditions, in the digital economy, the contradiction is "hidden" through algorithmic mechanisms, reward and punishment policies, and evaluation systems. Workers do not directly confront their employers, but are still subject to a centralized and opaque control system.

5.2. Historical Mission and Limitations in the Current Context

Relating to the theory of the historical mission of the working class, it can be seen that, ideally, the working class is a force capable of recognizing and reforming social injustices, aiming for a more equitable production system. However, in the current context of the working class, the ability to fulfill this mission faces many structural limitations.

First, the working class is highly dispersed. Each worker operates independently, without a shared workspace and lacking forms of collective organization, thereby diminishing the ability

to connect and form collective strength – a core element in fulfilling the historical role of the working class.

Secondly, the temporary and flexible nature of the work means that workers do not consider it a long-term career. Survey results show that the majority of participants do not intend to stay long-term, leading to a lack of motivation to care about structural issues such as labor rights or system reform.

Thirdly, control through technology and algorithms creates a new form of management in which workers are coordinated but the controlling entity is difficult to identify. This reduces the ability to recognize class conflict, thereby limiting the formation of class consciousness and collective action.

From the above analysis, it can be assessed that in the short term, the ability of the working class to fully fulfill its historical mission in the fundamental labor sector is limited due to a lack of organization, limitations in class consciousness, and strong technological control. However, in the long term, this possibility still exists if there is an improvement in workers' awareness, the development of representative organizations, and the refinement of the legal system to regulate labor relations in the digital economy.

Thus, conflicts of interest in labor are a concrete manifestation of the conflict between labor and capital in the new conditions of the digital economy. Although the working class still holds a central role in socialist theory, in the current context, fulfilling its historical mission faces many challenges. This requires new conditions in terms of organization, awareness, and policy to effectively promote the role of the working class in a manner consistent with the modern development context.

VI. Personal Comments and Suggestions

From an individual viewpoint, the center issue of stage labor lies not as it were in working conditions or salary levels, but more on a very basic level in how laborers see and acknowledge their position within the generation relationship. Studies appear that numerous individuals, in spite of being mindful of the dangers (unstable income, lack of insurance, time pressure), still see reliance on the application as "normal." This "normalization" obscures the mindfulness of labor rights, avoiding the request for security and enhancement of working conditions from getting to be a solid sufficient inspiration.

A noteworthy paradox is the "formal freedom" of stage labor. Specialists can select their working hours, but they have no control over their wage, arrange volume, and dissemination rules - variables that decide labor results. In this way, "freedom" basically exists on the surface, whereas the real reliance lies at a more profound level, through algorithms and platform arrangements. This is often a frame of auxiliary and circuitous control, more difficult to recognize than the traditional labor demonstrates, but it features a solid impact on the complete labor handle.

From a critical perspective, it can be contended that the stage labor show not as it were "creates flexible jobs" as businesses regularly communicate, but moreover redistributes chance in a way that's unfavorable to laborers. The need of contracts and protections strengths specialists to bear the costs and dangers themselves (accidents, order fluctuations, fuel costs). At the same time, the reward-punishment and positioning components increment execution weight, making an exceedingly competitive but unprotected environment. This raises questions not as it were around financial proficiency but moreover almost social value and the supportability of the improvement show.

However, it is essential to recognize dialectically that stage labor too offers commonsense openings, particularly for understudies: simple to connect, adaptable hours, and reasonable for the got to win additional wage. The issue isn't almost dismissing the show, but approximately altering it to adjust financial proficiency and workers' rights. From the over examination, arrangements can be proposed at three levels:

To begin with, at the individual level, specialists have to move forward with their advanced and proficient aptitudes to diminish their reliance on a single stage. Understanding how the application works (peak hours, high-demand areas, route optimization) can offer assistance progress pay within the brief term. Within the long term, broadening employment (combining multiple income sources, learning additional skills) is fundamental to maintain a strategic distance from delayed reliance.

At the undertaking level, stages like Grab and ShopeeFood ought to make their working components more straightforward, particularly the criteria for arrange conveyance, wage calculation methods, and remunerate and punishment controls. At the same time, thought ought to be given to executing least assurance instruments such as mischance protections back, extraordinary climate additional charges, or building up a least wage for crest hours. These alterations would not as it were progress working conditions but too contribute to the supportability of the stage biological system.

Thirdly, at the state and approach level, the lawful system for stage specialists ought to be finalized before long, recognizing and securing a modern shape of labor relations. This seems to incorporate: adaptable protections controls reasonable for casual laborers; prerequisites for algorithmic straightforwardness to guarantee reasonableness; and viable checking and complaint determination instruments. In expansion, the arrangement of representative organizations or proficient affiliations ought to be energized to reinforce the collective voice of specialists.

In brief, stage specialists are a double wonder: they both grow work openings and increment insecurity and chance. The arrangement lies not in dispensing with the show, but in re-establishing an adjustment of interface through improved personal mindfulness, corporate duty, and the administrative part of the State. As it were at that point will the advancement of the computerized economy be followed by maintainable social advance. From an individual viewpoint, I accept that applying Marxist-Leninist theory to the examination of stage labor is suitable, but it should be understood in a more adaptable instead of inflexible way. In case we

only see the "freedom" of the work, we will easily conclude that it is typically not a conventional labor relationship. In any case, when analyzing control and reliance more deeply, we are able to see that the nature of the relationship between specialists and stages remains clearly topsy-turvy. Actually, I believe the greatest issue isn't the presence of this demonstration, but how it is working in a way that shifts the chance to the specialists. Without convenient alterations, this demonstrates may compound disparity within the long term, particularly for youthful laborers and understudies - who are less able to ensure their rights.

VII. Conclusion

Platform labor is a typical manifestation of the change of the working lesson within the setting of the computerized economy. Through the consider of a gather of understudies working as ride-hailing drivers, it can be confirmed that, in spite of the fact that the frame of labor has changed essentially compared to the conventional show, in essence, they still have a place to the present day working course, as they don't possess center implies of generation and must depend on stages to offer their labor.

The survey results clearly show the prominent characteristics of this labor gathering, counting tall reliance on stages, unsteady pay, need of social security, and moo level of organization. At the same time, patterns such as platformization, information, and individualization of labor have changed the shape of presence of the working lesson, but have not misplaced the pitch of the relationship between labor and capital.

Besides, conflicts of intrigues between specialists and businesses clearly reflect the rebuilding of generation relations within the computerized economy. Be that as it may, the working class's capacity to fulfill its verifiable mission in this setting is still restricted due to its fracture, need of linkages, and mechanical control.

From the above examination, it can be seen that accurately recognizing the nature and changes of the working lesson within the computerized economy is of critical significance not as it were hypothetically but moreover essentially. This shapes the premise for creating fitting approaches to secure workers' rights and direct the advancement of the computerized economy towards decency and supportability, in line with the objectives of communism.

IX. Appendix

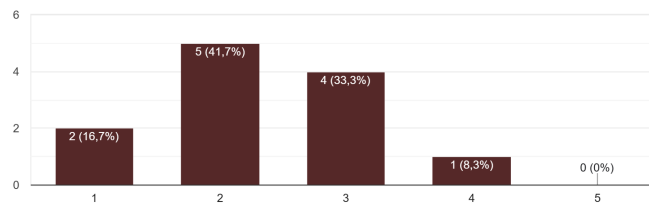

Câu 1: Độ tuổi của bạn là bao nhiêu?
12 câu trả lời

Câu 2: Giới tính của bạn
12 câu trả lời

Câu 9: Bạn đánh giá mức độ ổn định thu nhập của mình như thế nào?
12 câu trả lời

Câu 12: Áp lực bạn gặp phải từ hệ thống ứng dụng (app) là gì? (Nếu có)

9 câu trả lời

Áp lực giữ đánh giá cao, nếu bị khách đánh giá thấp sẽ bị giảm đơn. Ngoài ra còn bị áp lực thời gian giao hàng.

Không kiểm soát được công việc hoàn toàn: Không nhận đơn là bị giảm điểm

App thay đổi chính sách liên tục, không biết trước

Đôi khi bị áp lực vì khách hỏi giao nhanh, nếu giao trễ dễ bị đánh giá thấp.

nhiều đơn cùng lúc

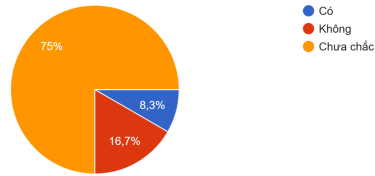

Người mới, số đơn sẽ ít

Chưa quen đường và cách nhận đơn nên giao hàng bị trễ

không có í kiến gì thêm

Phải chạy liên tục nhiều giờ để đạt thưởng.

Câu 17: Bạn có dự định gắn bó lâu dài với công việc này không?
12 câu trả lời

PHẦN 5: CÂU HỎI MỞ

Câu 18: Theo bạn, vấn đề lớn nhất của công việc giao hàng hiện nay là gì?
12 câu trả lời

- Thu nhập không ổn định vì phụ thuộc vào lượng đơn, có ngày nhiều có ngày rất ít
- ngày đơn nhiều thì kiếm được, nhưng có ngày rất ít đơn
- Công việc không ổn định
- Công việc không có bảo hiểm nên nếu xảy ra tai nạn thì rất rủi ro.
- Giao hàng trễ
- tắc đường
- Rủi ro tai nạn
- Vấn đề lớn nhất hiện nay là sự mất cân bằng giữa thu nhập và chi phí vận hành, đi kèm với các rủi ro về an toàn.
- Chi phí phát sinh cao: giá xăng tăng

Câu 19: Theo bạn, nền tảng (app) và shipper có mâu thuẫn lợi ích gì không? Nếu có, hãy mô tả.
9 câu trả lời

- App có quyền quyết định hết, shipper không có tiếng nói
- App đưa ra chính sách nhưng shipper không có quyền quyết định nên đôi khi thấy không công bằng.
- ko rõ
- Không
- Phí chiết khấu và thưởng
- App ưu tiên người chạy ship lâu nên người mới khó kiếm đơn.
- Có. Nền tảng thường muốn tối ưu chi phí và thời gian giao hàng nên có thể ép đơn, giảm thưởng, trong khi shipper muốn thu nhập cao và công việc linh hoạt. Điều này dễ dẫn đến mâu thuẫn về mức phí, thưởng/phạt và điều kiện làm việc
- App tăng yêu cầu thưởng nên shipper phải làm nhiều hơn để giữ thu nhập

Câu 20: Bạn có đề xuất gì để cải thiện điều kiện làm việc cho shipper?

12 câu trả lời

Nên có bảo hiểm cho shipper và minh bạch cách tính thưởng/phạt để công bằng hơn.

Nên có chính sách bảo hiểm cho shipper vì công việc có nhiều rủi ro.

Cần có luật bảo vệ shipper

Nên có hỗ trợ bảo hiểm và giảm áp lực thời gian giao hàng.

Có những chính sách khích lệ, khen thưởng

tăng phụ phí hợp lý

Tôn trọng những người làm shipper

Áp dụng mức phí hỗ trợ thêm khi thời tiết khắc nghiệt hoặc khi giao hàng vào các khung giờ cao điểm.

hỗ trợ an sinh xã hội
